

# Summary

## Week 46/2021 (15–21 November 2021)

- Influenza activity was low throughout the European Region.
- Of the 1 487 specimens tested for influenza viruses in week 46/2021 from patients presenting with ILI or ARI symptoms to sentinel primary healthcare sites, 72 (5%) were positive for influenza virus; 61 influenza A viruses (32 subtyped as A(H3), 11 subtyped as A(H1)pdm09) and 11 influenza B viruses (none with lineage determined).
- Hospitalized laboratory confirmed influenza cases were reported from ICU wards (4 influenza A viruses), and from SARI cases (2 influenza type A viruses).
- Influenza viruses were detected sporadically from non-sentinel sources (such as hospitals, schools, primary care facilities not involved in sentinel surveillance, or nursing homes and other institutions). Both influenza type A and type B viruses were detected.

## 2021-2022 season overview

- For the Region as a whole, influenza activity has been at baseline level with sporadic detections, mostly of A(H3) viruses.
- Influenza activity with influenza-confirmed patients in primary care or hospital settings with a rate of influenza virus detections above 10% has been reported from Israel, Russia, Tajikistan, Kyrgyzstan and Uzbekistan.
- During the influenza Vaccine Composition Meeting for the southern hemisphere 2022 season, held in September 2021, WHO recommended updating of the A(H3N2) and the B/Victoria-lineage components. The full report can be found [here](#).

## Other news

For more information about the SARS-CoV-2 situation in the WHO European Region visit:

- WHO website: <https://www.who.int/emergencies/diseases/novel-coronavirus-2019>
- ECDC website: <https://www.ecdc.europa.eu/en/novel-coronavirus-china>

## Influenza elsewhere

- The United States has reported an increase in A(H3N2) circulation over the last weeks with outbreaks observed in colleges and universities [HAN Archive - 00458 | Health Alert Network \(HAN\) \(cdc.gov\)](#)

## Qualitative indicators

For week 46/2021, of 40 countries and areas reporting on intensity of influenza activity, 32 reported baseline-intensity and 8 reported low-intensity (Azerbaijan, Bosnia and Herzegovina, Denmark, Estonia, Georgia, Kyrgyzstan, Slovakia and Kosovo (in accordance with Security Council resolution 1244 (1999))) (Fig. 1).

Of 40 countries and areas reporting on geographic spread of influenza viruses, 24 reported no activity, 15 reported sporadic spread and 1 reported regional spread (Kyrgyzstan) (Fig. 2).

For interactive maps of influenza intensity and geographic spread, see the [Flu News Europe website](#).

### Please note:

- Assessment of the intensity of activity indicator includes consideration of ILI or ARI rates. These ILI or ARI rates might be driven by respiratory infections other than influenza virus, including SARS-CoV-2, leading to observed increases in the absence of influenza virus detections.
- Assessment of intensity and geographic spread indicators includes consideration of sentinel and non-sentinel influenza virus detection data. Non-sentinel influenza virus detections, often higher, might translate into reporting of elevated geographic spread even in the absence of sentinel detections.

## Influenza positivity

For the European Region, influenza virus positivity in sentinel specimens remained below the epidemic threshold, which is set at 10% (Fig. 3).

**Figure 3. Influenza positivity in sentinel-source specimens by week, WHO European Region, seasons 2020/2021 and 2021/2022**

## External data sources

**Mortality monitoring:** For week 46/2021 overall pooled EuroMOMO estimates of all-cause mortality for the participating European countries shows no overall significant excess mortality. At country level, Ukraine is experiencing a very high increase in excess mortality temporally associated with COVID-19 circulation. Data from 26 European countries or subnational regions were included in this week 46/2021 pooled analysis of all-cause mortality.

The full EuroMOMO report can be found here: <https://www.euromomo.eu/>

## Primary care data

### Syndromic surveillance data

Of the countries and areas in which thresholds for ILI activity are defined, countries in eastern (n=5; Azerbaijan, Georgia, Kyrgyzstan, Russian Federation, Ukraine), northern (n=3; Denmark, Estonia, Ireland), southern (n=1; Serbia) and western (n=2; Austria, Belgium) areas of the European Region reported activity above baseline levels.

Of the countries and areas in which thresholds for ARI activity are defined, countries in eastern (n=3; Belarus, Kyrgyzstan, Russian Federation) and northern (n=1; Estonia) areas of the European Region reported activity above baseline levels.

## Please note:

1. Assessment of the syndromic surveillance data of ILI or ARI rates might be driven by respiratory infections other than influenza virus, including SARS-CoV-2, leading to observed increases in the absence of influenza virus detections. The thresholds mentioned are related to the MEM method and based on historical ILI/ARI data.

## Viruses detected in sentinel-source specimens (ILI and ARI)

For week 46/2021, 72 (5%) of 1 487 sentinel specimens tested positive for an influenza virus; 61 (85%) were type A and 11 (15%) were type B. Of 43 subtyped A viruses, 74% were A(H3) and 26% were A(H1)pdm09 (Fig. 4 and Table 1). Of 26 countries or areas across the Region that each tested at least 10 sentinel specimens in week 46/2021, 3 reported a rate of influenza virus detections above 10%: Israel (40%), Kyrgyzstan (38%) and Tajikistan (15%).

For the season to date, 152 (2%) of 8 743 sentinel specimens tested positive for an influenza virus. More influenza type A (n=137, 90%) than type B (n=15, 10%) viruses have been detected. Of 101 subtyped A viruses, 89 (88%) were A(H3) and 12 (12%) were A(H1)pdm09. No influenza type B viruses were ascribed to a lineage (Fig. 3 and Table 1).

Details of the distribution of viruses detected in non-sentinel-source specimens are presented in the [Virus characteristics](#) section.

**Table 1. Influenza virus detections in sentinel source specimens by type and subtype for week 46/2021 and cumulatively for the season**

Sentinel Virus type and subtype	Current Week (46)		Season 2021-2022	
	Number	% <sup>a</sup>	Number	% <sup>a</sup>
<b>Influenza A</b>	<b>61</b>	<b>84.7</b>	<b>137</b>	<b>90.1</b>
A(H1)pdm09	11	25.6	12	11.9
A(H3)	32	74.4	89	88.1
A not subtyped	18	-	36	-
<b>Influenza B</b>	<b>11</b>	<b>15.3</b>	<b>15</b>	<b>9.9</b>
B/Victoria lineage	0	0	0	0
B/Yamagata lineage	0	0	0	0
Unknown lineage	11	-	15	-
<b>Total detections (total tested)</b>	<b>72 (1 487)</b>	<b>4.8</b>	<b>152 (8 743)</b>	<b>1.7</b>

<sup>a</sup> For influenza type percentage calculations, the denominator is total detections; for subtype and lineage, it is total influenza A subtyped and total influenza B lineage determined, respectively; for total detections, it is total tested.

## External data sources

[Influenzanet](#) collects weekly data on symptoms in the general community from different participating countries across the EU/EEA. Please refer to the website for additional information for week 46/2021.

## Hospital surveillance

A subset of countries and areas monitor severe disease related to influenza virus infection by surveillance of 1) hospitalized laboratory-confirmed influenza cases in ICUs or other wards, or 2) severe acute respiratory infection (SARI; mainly in the eastern part of the Region).

## Laboratory-confirmed hospitalized cases

### 1.1) Hospitalized laboratory-confirmed influenza cases – ICUs

For week 46/2021, 4 laboratory-confirmed influenza cases were reported from ICU wards (in France, Sweden and United Kingdom (England)). The patients were infected with influenza type A viruses, but subtype was not ascribed (Fig. 4 and 5).

Since week 40/2021, more influenza type A (n=13, 93%) than type B (n=1) viruses were detected. Of 3 subtyped influenza A viruses, 2 were A(H1)pdm09 and 1 A(H3). No influenza B viruses were ascribed to a lineage. Of 7 cases with known age, 3 were 65 years and older, 2 were 0-4 years old, one was 5-14 years old and one was 15-64 years old.

 Reproduction is authorised, provided the source is acknowledged.

**1.2) Hospitalized laboratory-confirmed influenza cases – other wards**

For week 46/2021, there were no reports of hospitalized laboratory-confirmed influenza cases in other wards (Fig. 6 and 7).

Since week 40/2021, there has been 1 influenza type A virus and no influenza type B viruses detected. The influenza A virus was not ascribed to a subtype. The case was 0-4 years old.

## Severe acute respiratory infection (SARI)-based hospital surveillance

For week 46/2021, 2 199 SARI cases were reported by 9 countries or areas (Albania, Georgia, Malta, Montenegro, Republic of Moldova, Russian Federation, Serbia, Spain and Ukraine). Of 262 specimens tested for influenza viruses, 1% (n=2) were positive. Both were influenza type A viruses (no subtype was assigned).

For week 46/2021, 8 countries or areas reported a total of 576 tests and 284 detections of SARS-CoV-2 virus (49% detections overall, varying from 22% in Republic of Moldova and Malta, to 91% in Montenegro) from SARI cases.

For the season, 30 601 SARI cases were reported by 18 countries or areas (Albania, Armenia, Belarus, Georgia, Germany, Kazakhstan, Kyrgyzstan, Malta, Montenegro, North Macedonia, Republic of Moldova, Russian Federation, Serbia, Spain, Turkey, Ukraine, Uzbekistan and Kosovo (in accordance with Security Council resolution 1244 (1999))). Of 100 SARI cases testing positive for influenza virus since week 40/2021, 99 (99%) were infected with type A viruses and all 97 subtyped were A(H3) viruses. The influenza type B virus was not ascribed to a lineage (Fig. 8).

## Virus characteristics

Details of the distribution of viruses detected in sentinel-source specimens can be found in the [Primary care data](#) section.

## Non-sentinel virologic data

For week 46/2021, 439 of 54 720 specimens from non-sentinel sources (such as hospitals, schools, primary care facilities not involved in sentinel surveillance, or nursing homes and other institutions) tested positive for an influenza virus; 393 (90%) were type A and 46 (10%) were type B. Of 190 subtyped A viruses, 179 (94%) were A(H3) and 11 (6%) were A(H1)pdm09. No B viruses were ascribed to a lineage (Fig. 9 and Table 2).

For the season to date, more influenza type A (n=1 480, 86%) than type B (n=230, 14%) viruses have been detected. Of 961 subtyped A viruses, 909 (95%) were A(H3) and 52 (5%) were A(H1)pdm09. Of 2 influenza type B viruses ascribed to a lineage, both were B/Victoria (99% of type B viruses were reported without a lineage) (Fig. 9 and Table 2).

**Figure 9. Influenza detections by type, subtype/lineage and week, WHO European Region, season 2021/2022**

**Table 2. Influenza virus detections in non-sentinel source specimens by type and subtype, week 46/2021 and cumulative for the season**

Virus type and subtype	Current Week (46)		Season 2021-2022	
	Number	% <sup>a</sup>	Number	% <sup>a</sup>
<b>Influenza A</b>	<b>393</b>	<b>89.5</b>	<b>1 480</b>	<b>86.5</b>
A(H1)pdm09	11	5.8	52	5.4
A(H3)	179	94.2	909	94.6
A not subtyped	203	-	519	-
<b>Influenza B</b>	<b>46</b>	<b>10.5</b>	<b>230</b>	<b>13.5</b>
B/Victoria lineage	0	0	2	0
B/Yamagata lineage	0	0	0	0
Unknown lineage	46	-	228	-
<b>Total detections (total tested)</b>	<b>439 (54 720)</b>	<b>-</b>	<b>1 710 (350 685)</b>	<b>-</b>

<sup>a</sup> For type percentage calculations, the denominator is total detections; for subtype and lineage, it is total influenza A subtyped and total influenza B lineage determined, respectively; as not all countries have a true non-sentinel testing denominator, no percentage calculations for total tested are shown.

## Genetic characterization

Up to week 46/2021, 93 A(H3) viruses had been characterized genetically, all of which belonged to clade 3C.2a1b.2a.2. One A(H1) virus collected in week 42 was characterized genetically without clade assignment.

ECDC published the [October](#) virus characterization report that describes the available data from circulating viruses collected after 31 August 2020. This and previously published influenza virus characterization reports are available on the [ECDC website](#).

## **Antiviral susceptibility of seasonal influenza viruses**

Up to week 46/2021, 87 A(H3) viruses were assessed for susceptibility to neuraminidase inhibitors and 42 A(H3) viruses were assessed for susceptibility to the Polymerase acid protein (PA) inhibitor baloxavir marboxil. No amino acid substitutions previously associated with reduced susceptibility were identified in either influenza virus protein.

## Vaccine

Recently published results from a controlled, randomised trial in UK concluded that concomitant vaccination with one of two SARS-CoV-2 vaccines (ChAdOx1 or BNT162b2) plus an age-appropriate influenza vaccine raised no safety concerns and preserves [antibody responses](#) to both vaccines.

### Available vaccines in Europe

<https://www.ecdc.europa.eu/en/seasonal-influenza/prevention-and-control/vaccines/types-of-seasonal-influenza-vaccine>

## Vaccine composition

**On 24 September 2021, WHO published recommendations for the components of influenza vaccines for use in the 2022 southern hemisphere influenza season:**

### Egg-based Vaccines

- an A/Victoria/2570/2019 (H1N1)pdm09-like virus;
- an A/Darwin/9/2021 (H3N2)-like virus;
- a B/Austria/1359417/2021 (B/Victoria lineage)-like virus; and
- a B/Phuket/3073/2013 (B/Yamagata lineage)-like virus.

### Cell- or recombinant-based Vaccines

- an A/Wisconsin/588/2019 (H1N1)pdm09-like virus;
- an A/Darwin/6/2021 (H3N2)-like virus;
- a B/Austria/1359417/2021 (B/Victoria lineage)-like virus; and
- a B/Phuket/3073/2013 (B/Yamagata lineage)-like virus.

It is recommended that **trivalent influenza vaccines** for use in the 2022 southern hemisphere influenza season contain the following:

### Egg-based vaccines

- an A/Victoria/2570/2019 (H1N1)pdm09-like virus;
- an A/Darwin/9/2021 (H3N2)-like virus; and
- a B/Austria/1359417/2021 (B/Victoria lineage)-like virus.

## Cell- or Recombinant-based vaccines

- an A/Wisconsin/588/2019 (H1N1)pdm09-like virus;
- an A/Darwin/6/2021 (H3N2)-like virus; and
- a B/Austria/1359417/2021 (B/Victoria lineage)-like virus

The full report is published [here](#).

**On 26 February 2021, WHO published [recommendations](#) for the components of influenza vaccines for use in the 2021-2022 northern hemisphere influenza season:**

## Egg-based Vaccines

- an A/Victoria/2570/2019 (H1N1)pdm09-like virus;
- an A/Cambodia/e0826360/2020 (H3N2)-like virus;
- a B/Washington/02/2019 (B/Victoria lineage)-like virus; and
- a B/Phuket/3073/2013 (B/Yamagata lineage)-like virus.

## Cell- or recombinant-based Vaccines

- an A/Wisconsin/588/2019 (H1N1)pdm09-like virus;
- an A/Cambodia/e0826360/2020 (H3N2)-like virus;
- a B/Washington/02/2019 (B/Victoria lineage)-like virus; and
- a B/Phuket/3073/2013 (B/Yamagata lineage)-like virus.

It was recommended that the influenza B virus component of **both trivalent vaccine types** for use in the 2021–2022 northern hemisphere influenza season should be a B/Washington/02/2019-like virus of the B/Victoria-lineage.

This weekly update was prepared by an editorial team at the European Centre for Disease Prevention and Control (Cornelia Adlhoch, Carlos Carvalho, Nishi Dave, and Pasi Penttinen) and the WHO Regional Office for Europe (Margaux Meslé, Piers Mook and Richard Pebody).

External reviewers are: Rod Daniels, WHO Collaborating Centre for Reference and Research on Influenza, Francis Crick Institute (United Kingdom) and Adam Meijer, National Institute for Public Health and the Environment (the Netherlands),

Maps and commentary do not represent a statement on the legal or border status of the countries and territories shown.

All data are up to date on the day of publication. Past this date, however, published data should not be used for longitudinal comparisons, as countries retrospectively update their databases.
